How to run the code (Python):

1) Make sure the .txt log files are deleted from the code directory (the program makes them).

2) Put TCP_Server.py, TCP_Client.py, and main.py into the same directory.

3) Open one terminal to run the main script by using the command "python main.py"

4) Allow the program to run for more than 5 seconds (I did about 10 seconds) to allow the safety delay to run

5) Use ctrl+c to stop the programs and wait a few seconds for the threads to terminate and the client to close its connection.

6) The client and server logs will be created as .txt files and you can check them to see their interactions.
